

Storia Della Scultura Dal Suo Risorgimento in Italia Fino Al Secolo Di Canova Per Servire Di Continuazione Allopere Di Winckelmann E Di DAgincourt (6)

Filesize: 5.44 MB

Reviews

This is actually the best ebook we have read till now. Indeed, it can be enjoy, nevertheless an interesting and amazing literature. You will not feel monotony at whenever you want of the time (that's what catalogs are for regarding should you question me).
(Jamar Stracke)

STORIA DELLA SCULTURA DAL SUO RISORGIMENTO IN ITALIA FINO AL SECOLO DI CANOVA PER SERVIRE DI CONTINUAZIONE ALLOPERE DI WINCKELMANN E DI DAGINCOURT (6)

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 50 pages. Original publisher: Hampton, Va : National Aeronautics and Space Administration, Langley Research Center : Institute for Computer Applications in Science and Engineering, 1985 OCLC Number: (OCoLC)476741760 Excerpt: . . . vectors or matrices in context. The vector-matrix combination is invalid because of the ambiguity in interpretation; the vector could be expanded either as a matrix of column vectors or of row vectors. The programmer must, in order to have a vector-matrix combination, use either MATC which generates a matrix of column vectors or MATR which generates a matrix of row vectors. The MERGE function sets the elements of matrix Z equal to the corresponding elements of X, for those elements of L which are true, and to the corresponding elements of Y, for those elements of L which are false. This function can be used to implement conditional, data dependent calculations. For example, a branch instruction with two branches can be implemented by (1) calculating the results of the first branch and storing them in matrix X; (2) calculating the results of the second branch and storing them in Y; (3) generating the mask using the data test with, say, true denoting the first branch and false the second branch; (4) finally, calling MERGE. By convention the first index of a matrix, the I of X (I, J), labels the rows and the second labels the columns, see Figure 3. The DAP convention labels the first row of the array as the North and the first column as the West. These conventions are used in the shifting functions, SHEP (X, N) for example. This function shifts (SH) the X matrix N columns...
